

Source code:

```
#include <iostream>
#include <string>
bool isValidIdentifier(const std::string &identifier) {
    if (identifier.empty())
        return false;
    if (identifier[0] < 'a' || identifier[0] > 'z')
        return false;
    for (int i = 1; i < identifier.size(); i++) {
        char ch = identifier[i];
        if (!((ch >= 'a' && ch <= 'z') || (ch >= '0' && ch <= '9')) {
            return false; // If not, it's invalid
        }
    }
    return true;
}

int main() {
    std::string identifier;
    std::cout << "Enter an identifier: ";
    std::cin >> identifier;
    if (isValidIdentifier(identifier)) {
        std::cout << "This is a valid identifier.\n";
    } else {
        std::cout << "This is NOT a valid identifier.\n";
    }
}
```

```
}  
return 0;  
}
```

Output:

```
Enter an identifier: totalmarks  
This is a valid identifier.
```

```
Enter an identifier: sum1  
This is a valid identifier.
```

```
Enter an identifier: 5marks  
This is NOT a valid identifier.
```

```
Enter an identifier: 153648  
This is NOT a valid identifier.
```
